Create and Managing Color and Effect Styles

# Eliminate Possible Errors!?How?

Starting from now, you will no longer have **random frame sizes**, colors, fonts, and other elements in your design files.

From now on, you have to move forward only when you are confident in every step of creating the interface of your application.

Therefore, you will need **tools to help you minimize or eliminate possible errors**. One of these is **grids**.

# Grids are everywhere

Publishers, editors, and writers looked to grids for the perfect **harmony of displaying content** on pages. Because the **same grid** was applied to all pages, text and images were **consistent throughout the book** or magazine.

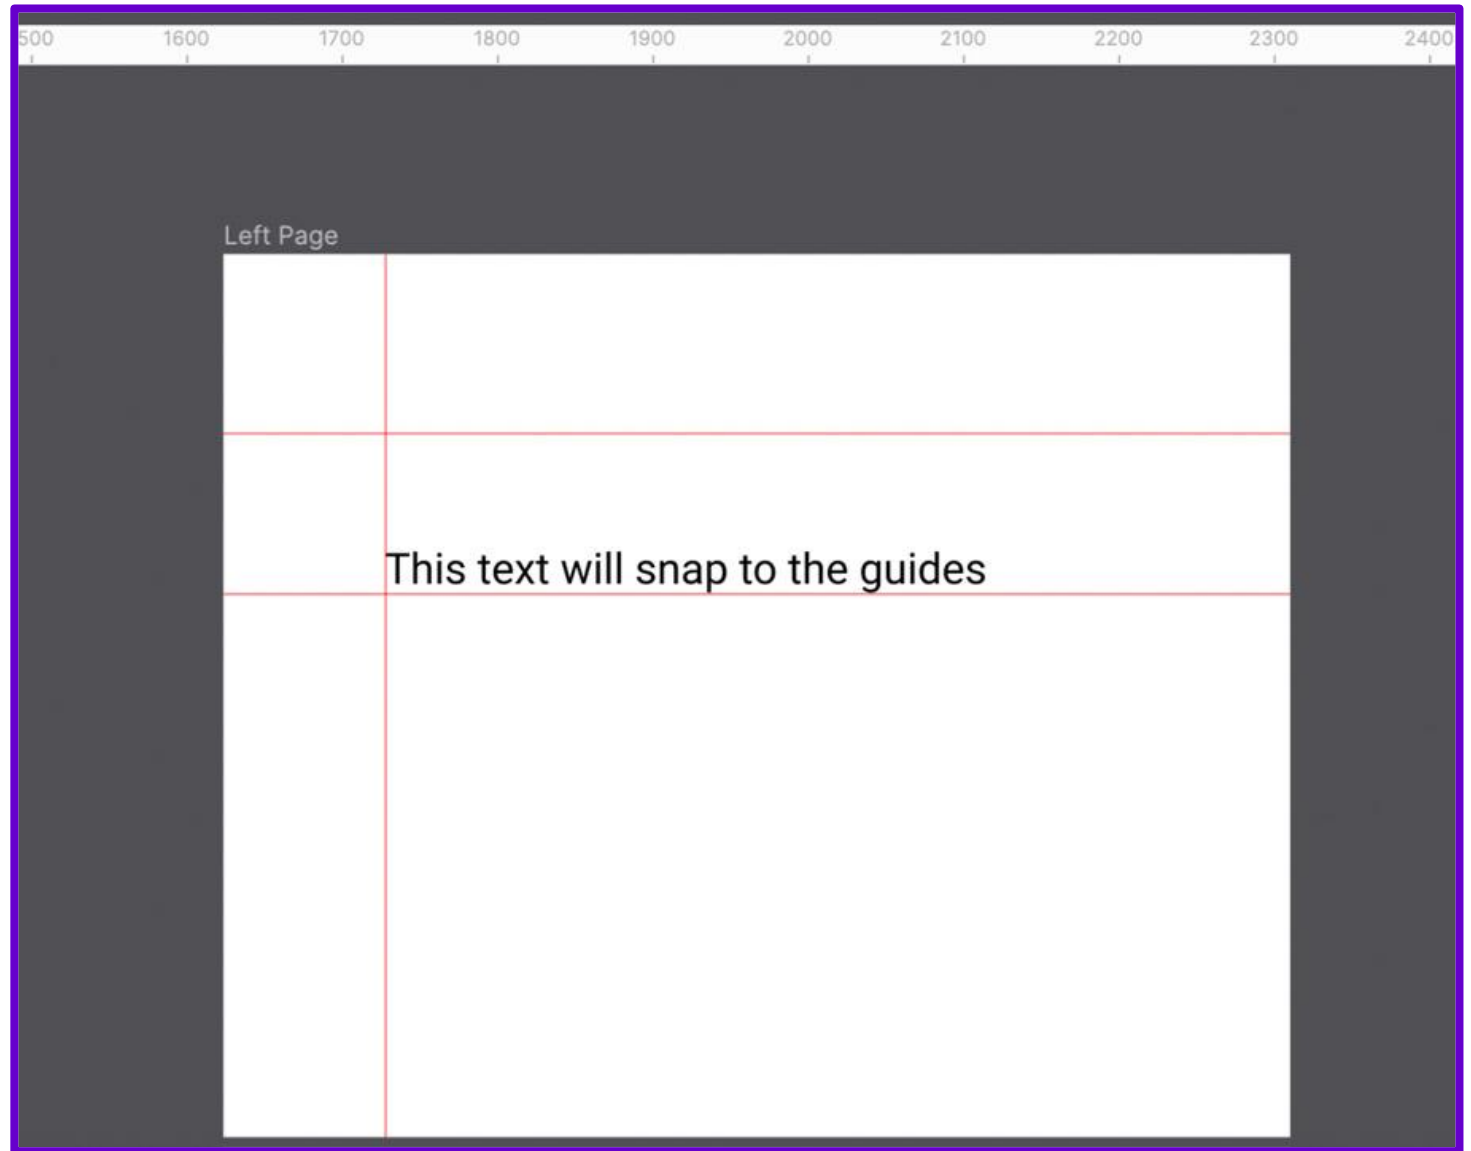

# Why We Use Grids?

All elements must be **organized** with **harmony** and **consistency** throughout **all pages** so that the user is not distracted from the content.

# Guides

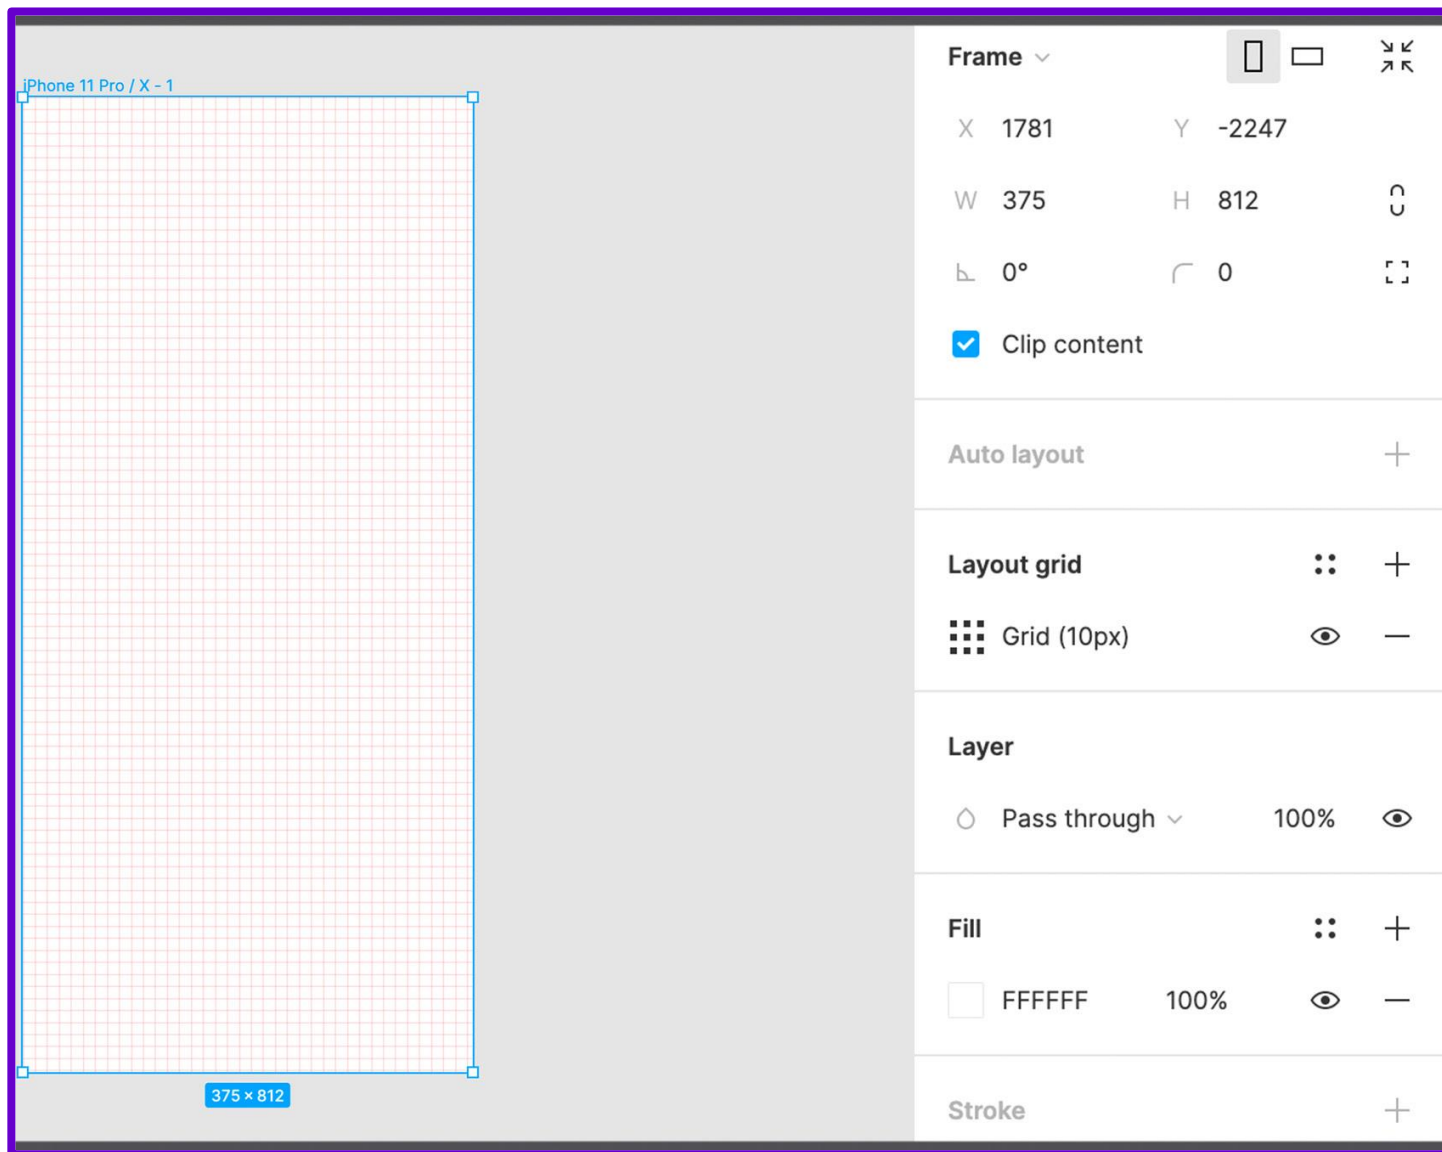

You will need guides when you need to relate elements and check their alignment, position, and size.

(Shift + R keyboard shortcut)

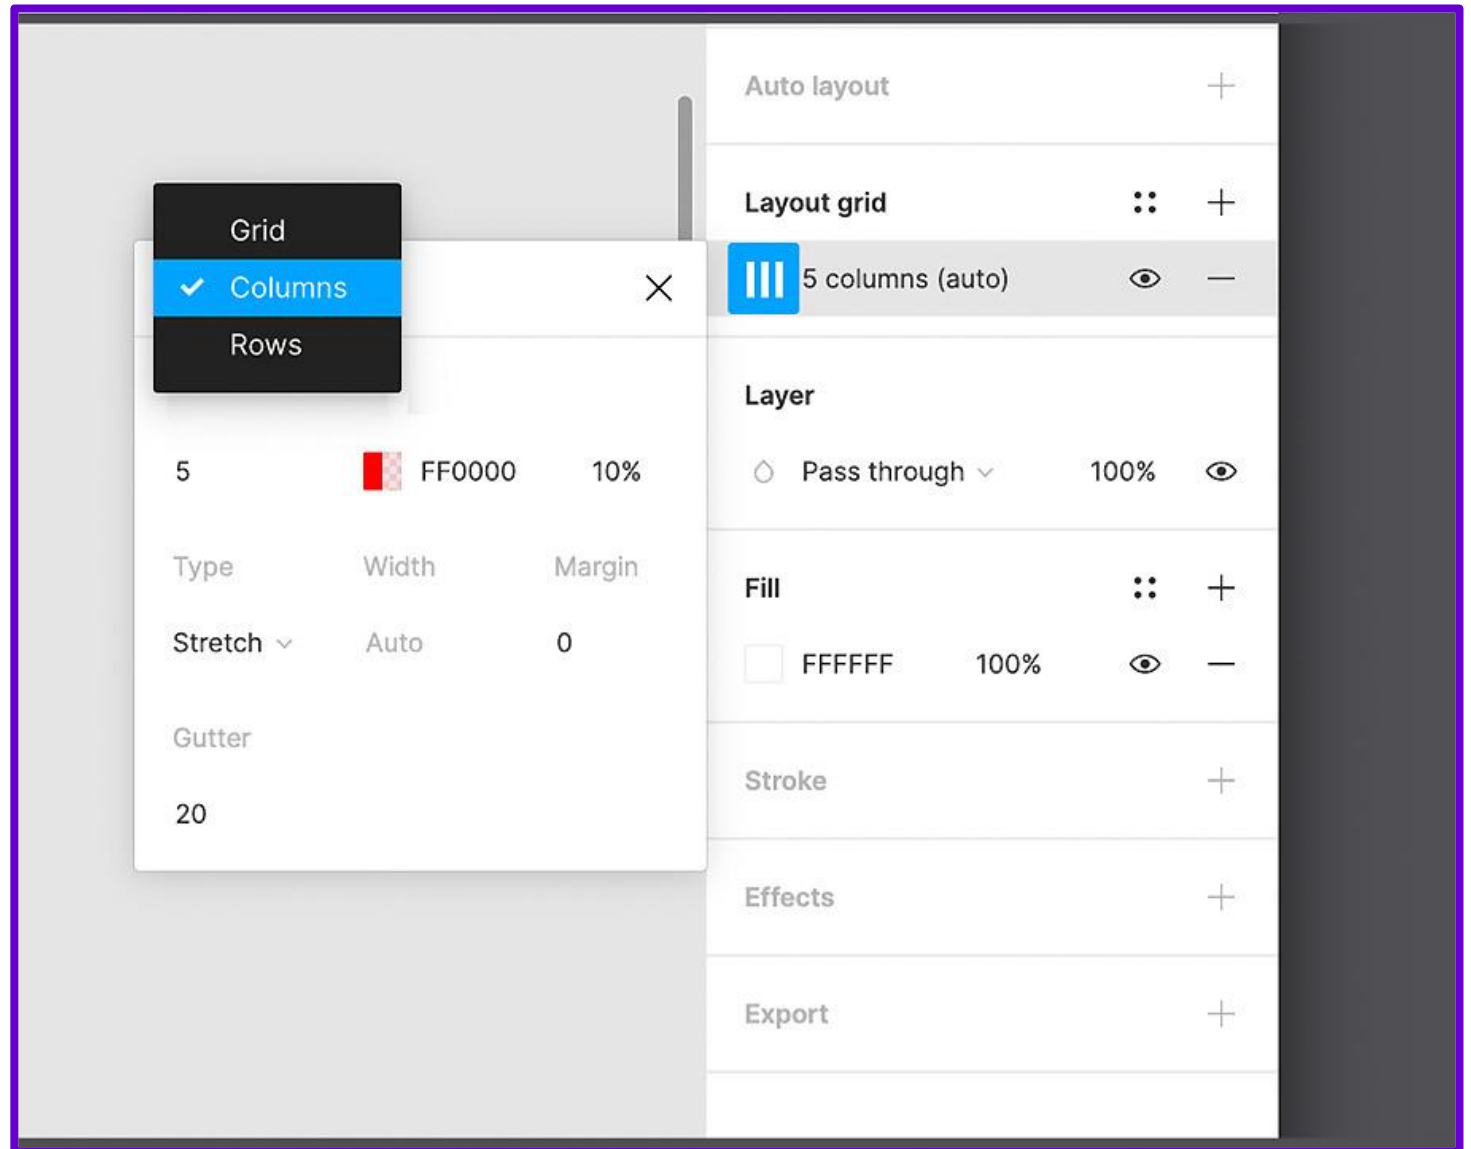

# Layout grid

As a more complex function than Guides, layout grids open up new possibilities for designers to create consistent product designs across multiple platforms.

# Setting Proper Layout Grids

You need to select the correct properties for grids. Many web development frameworks use 12-column grids to better organize content within them.

Create and Managing Color and Effect Styles

# Typography Matters

Wrong typography choices instantly render a product non-functional and aesthetically unpleasant

This is because choosing the right font is not easy, and only experience, study, and practice can help you master this aspect.

# Factors of Choosing Write Font

## 1. Platform

if you want to build an app exclusively for iOS, it might be a good choice to use a system font such as San Francisco (sans-serif) or New York (serif). when building an Android app, the Roboto font might be a safe choice

San Francisco

*Sans-Serif typeface*

Aa Qq Rr

**Aa Qq Rr**

New York

*Serif typeface*

Aa Qq Rr

**Aa Qq Rr**

Roboto

*Sans-Serif typeface*

Aa Qq Rr

**Aa Qq Rr**

# Factors of Choosing Write Font

## 2. Context

In general, with sans-serif fonts being more readable by the human eye, they are suitable for menus, buttons, and so on.

And if you need to display very long text content, a serif font may be more appropriate.

you should check whether there are any technical limitations on the development side – each integrated font has weight and can consequently slow down the loading of an application

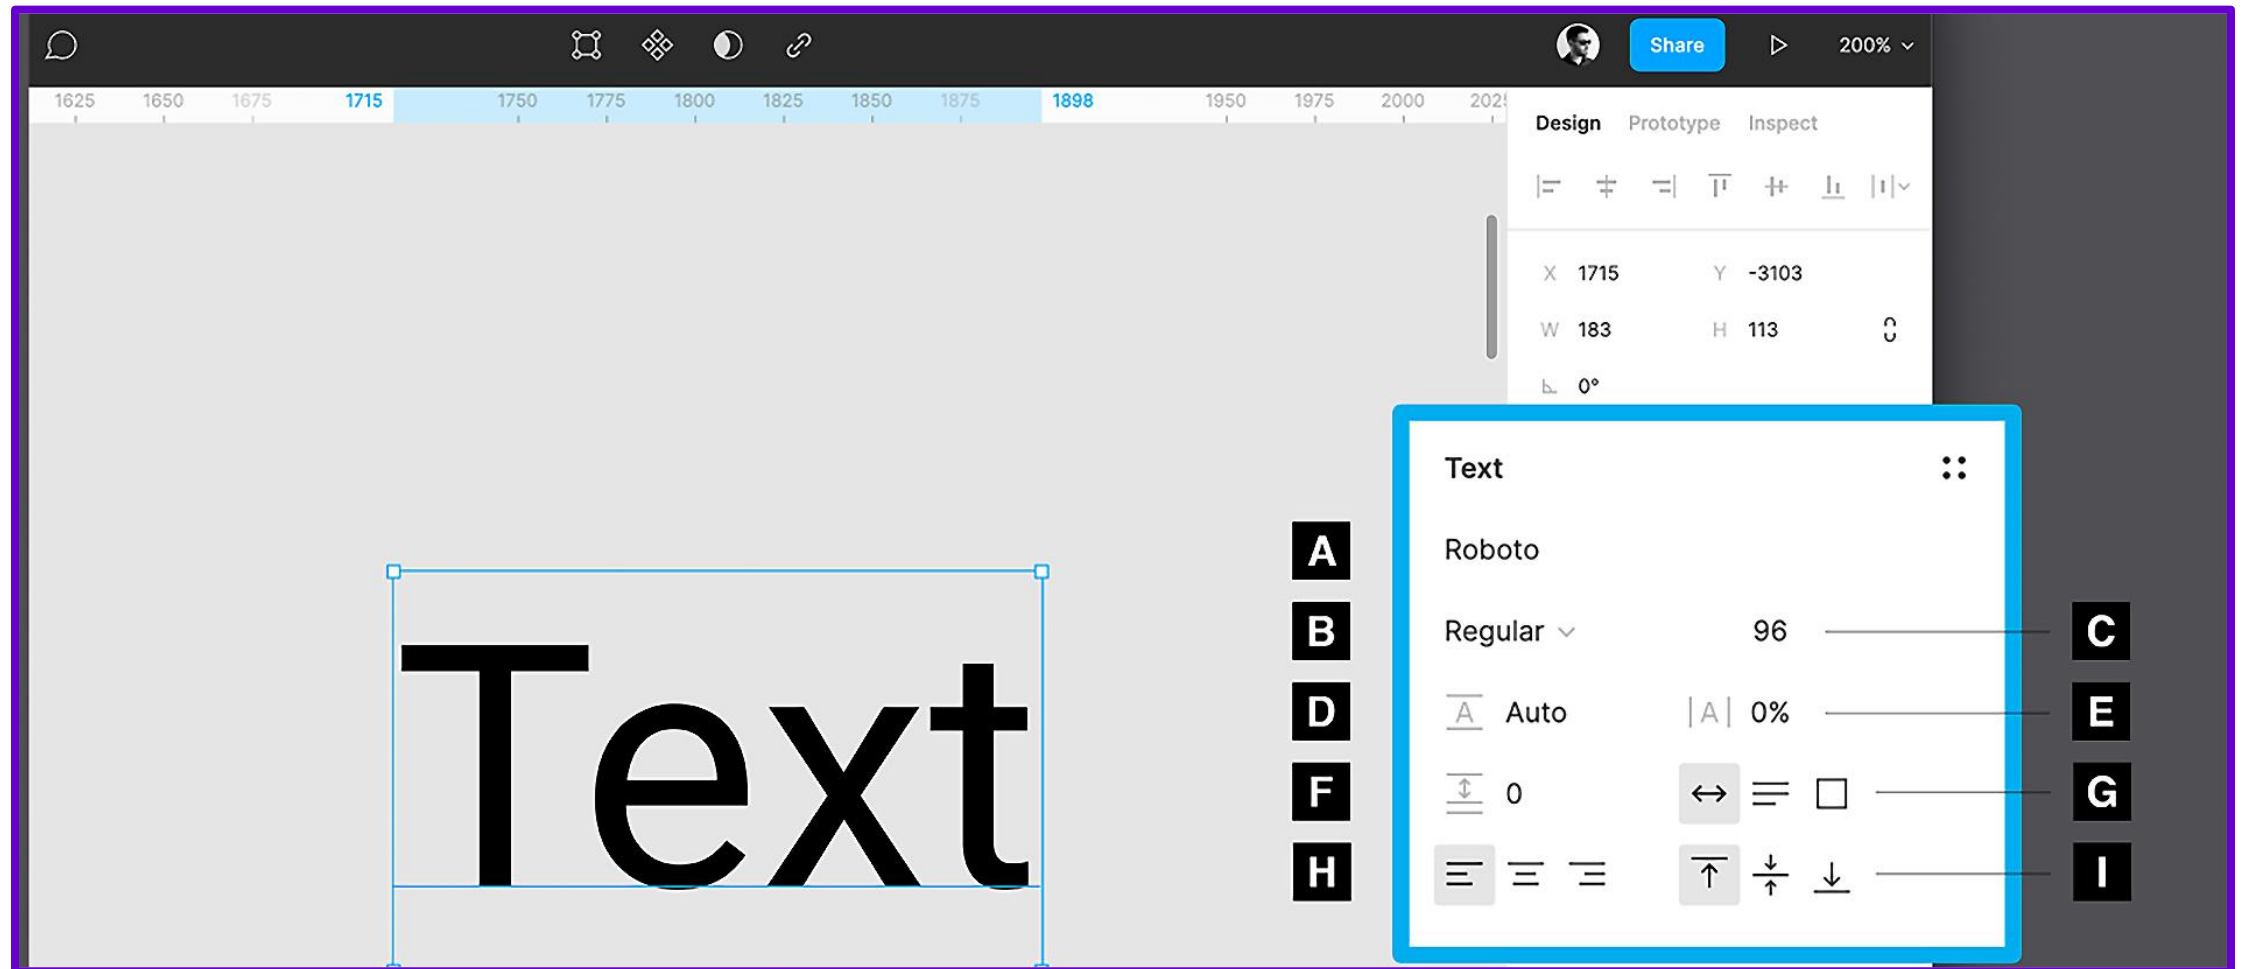

# Accessing to the fonts in Figma

Figma provides a huge selection of Google fonts (be sure that Show Google Fonts is enabled in Preferences), ready to operate in design files.

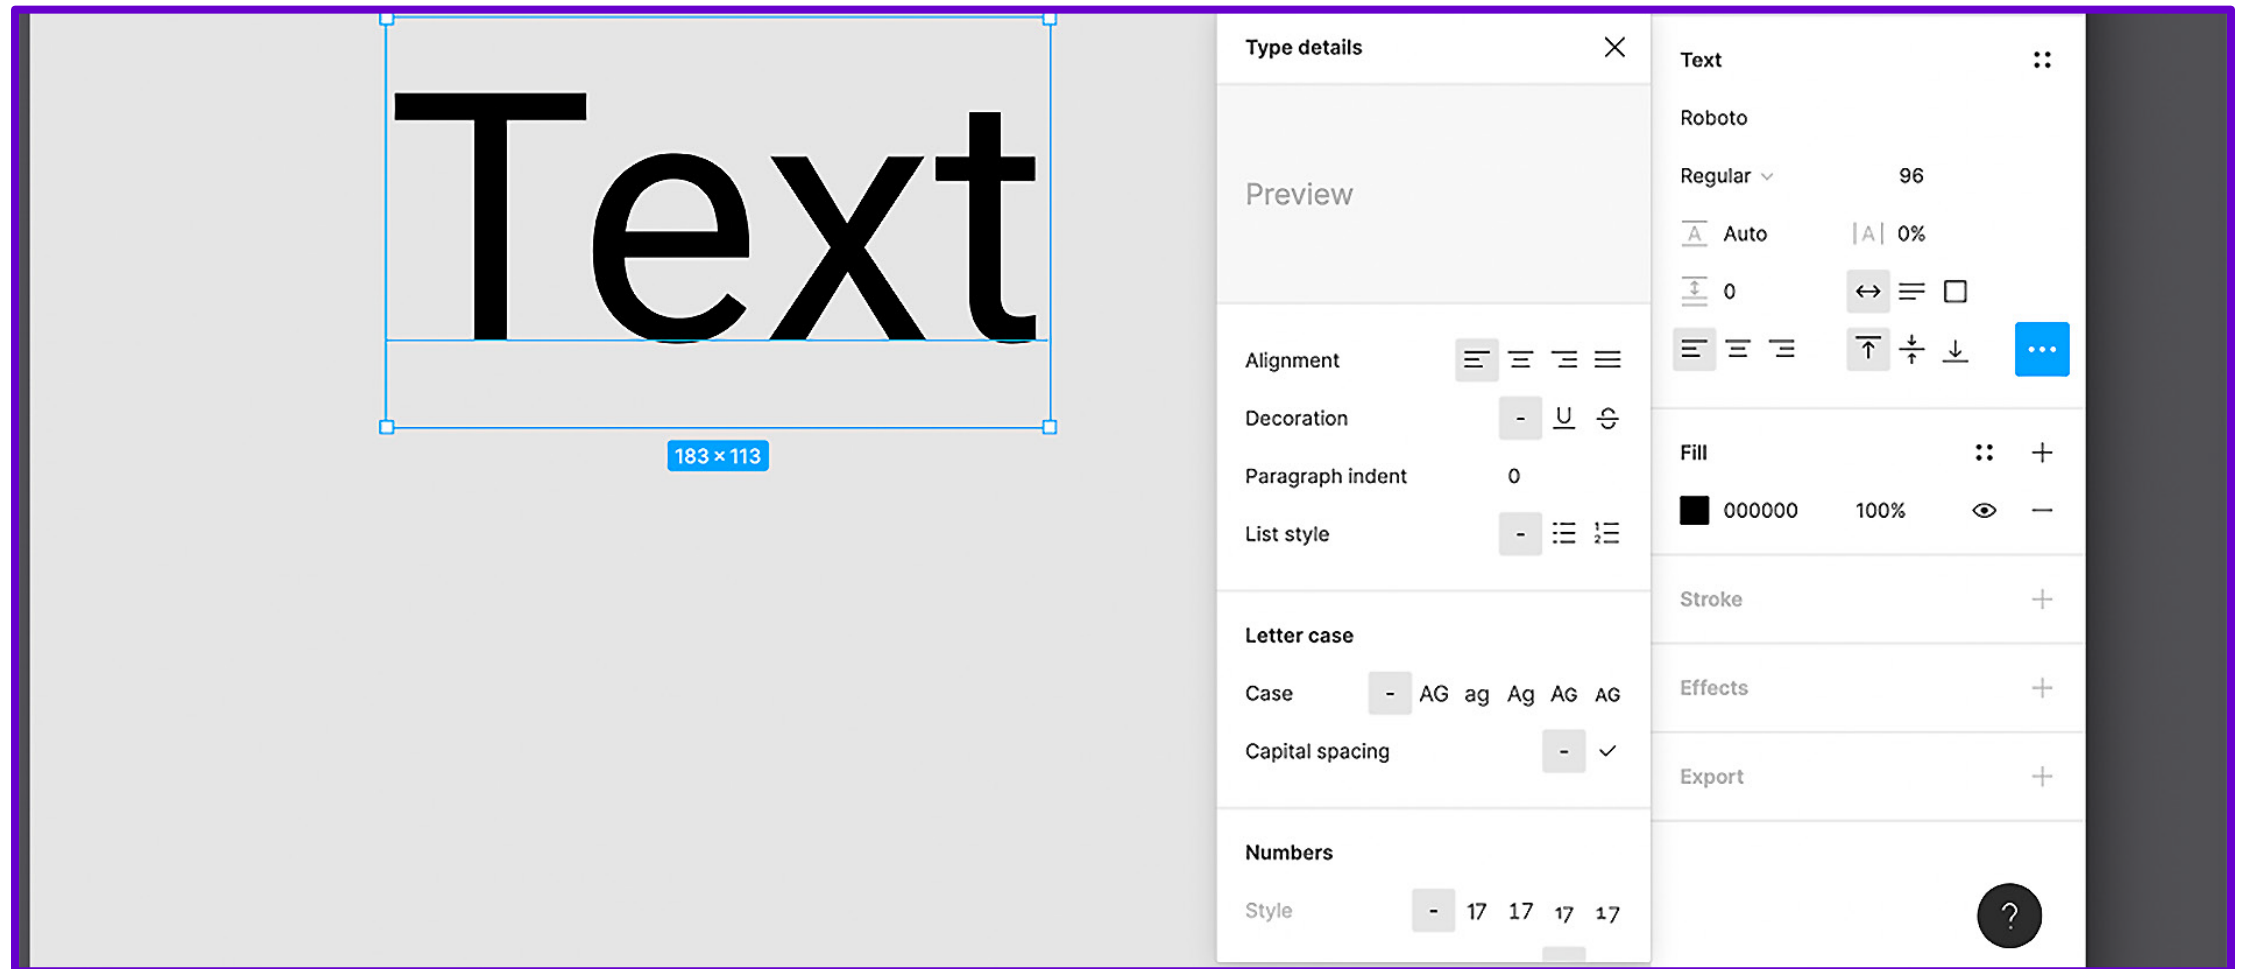

(<https://www.figma.com/google-fonts>.)

However, it may be that you have to use fonts that are not listed inside Figma. In this case, you should use the desktop version of Figma, where in addition to Google fonts, you will have at your disposal all the fonts installed on your computer.

Create and Managing Color and Effect Styles

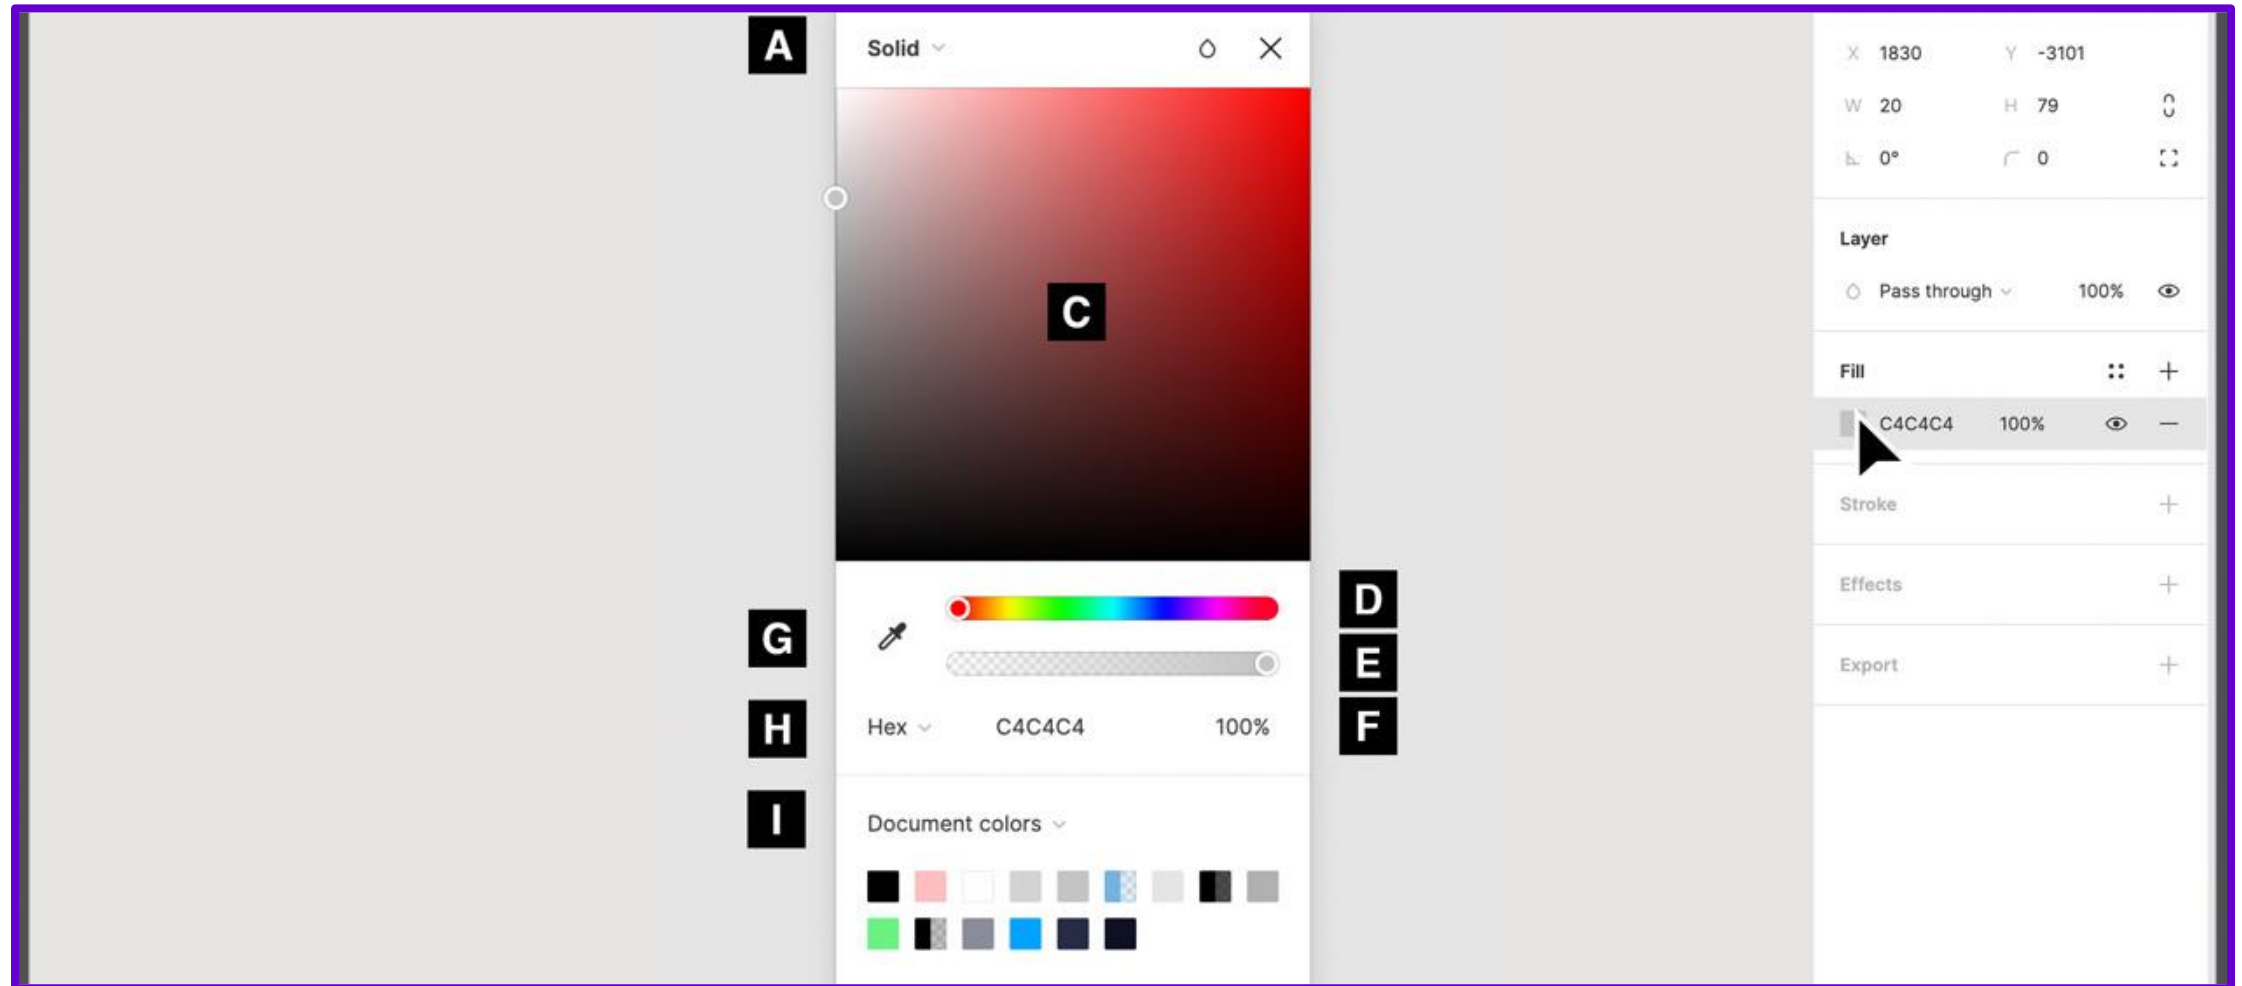

# Choosing a palette

You can have a **great user experience** in your application, but the perception of this **can be spoiled by the wrong choice of color palette**, and all your efforts will be wasted.

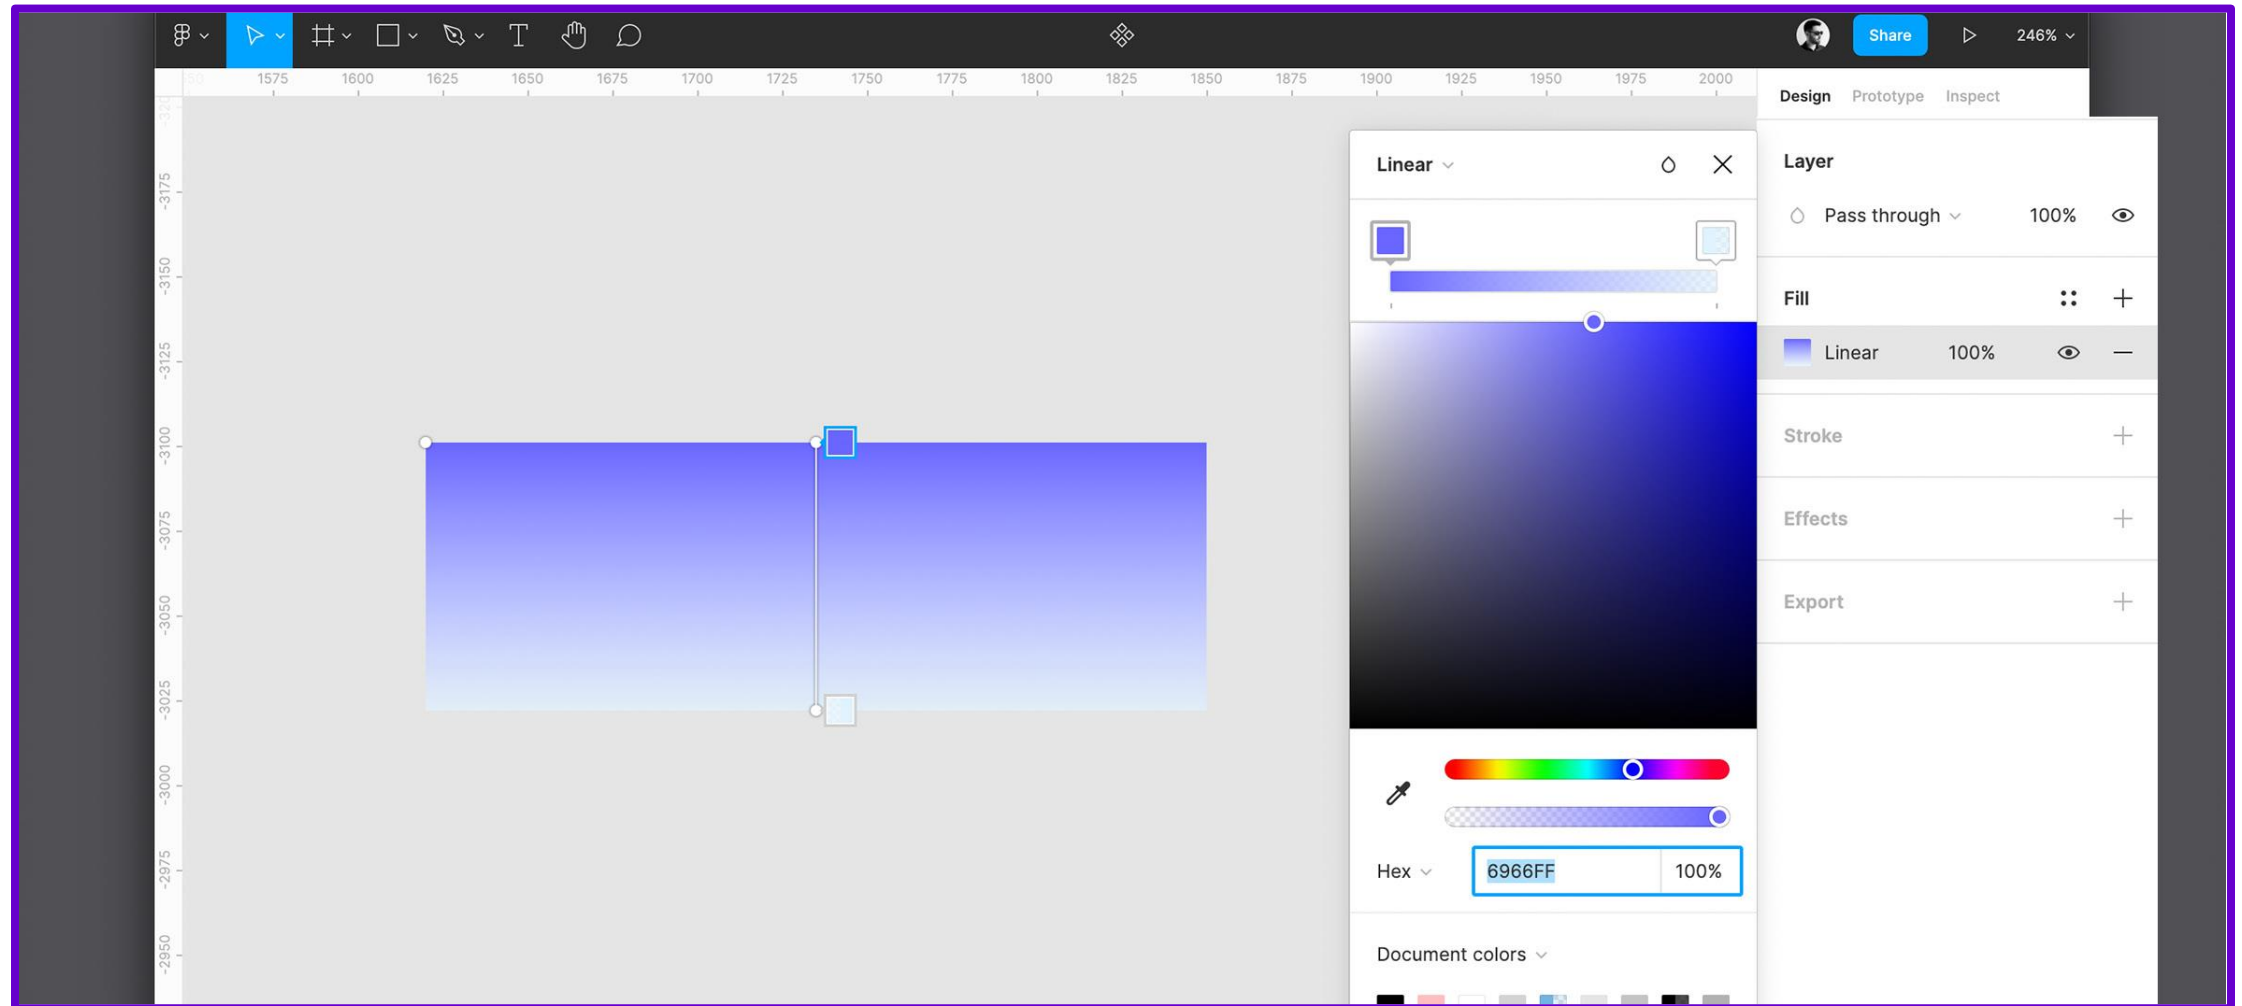

**Each color has its own message** and has a particular impact on people, so you need to make sure that your product interacts properly with the user.

# Creating effects

# Introducing styles in Figma

**Styles** in Figma is an incredibly powerful feature that **allows** you to **save** and **reuse** **color palettes, fonts, and effect** attributes in your design project.

This means that you can apply the approved style properties to any element with a single click. And if you ever need to change any property, you can do it just as quickly in all layers of your file, or even across multiple files!

# Editing grid styles

# Creating and managing text styles

# Creating and managing text styles

Our application will contain quite a lot of text on each page, so we need to have text styles as well.

As before, the first thing you do is create a foundation for the text styles that you will apply to the text layers in our interface

remember that you don't need to create all the text styles at once. It is normal practice to integrate new styles later if the original core of the style is well organized.

# Creating and managing text styles

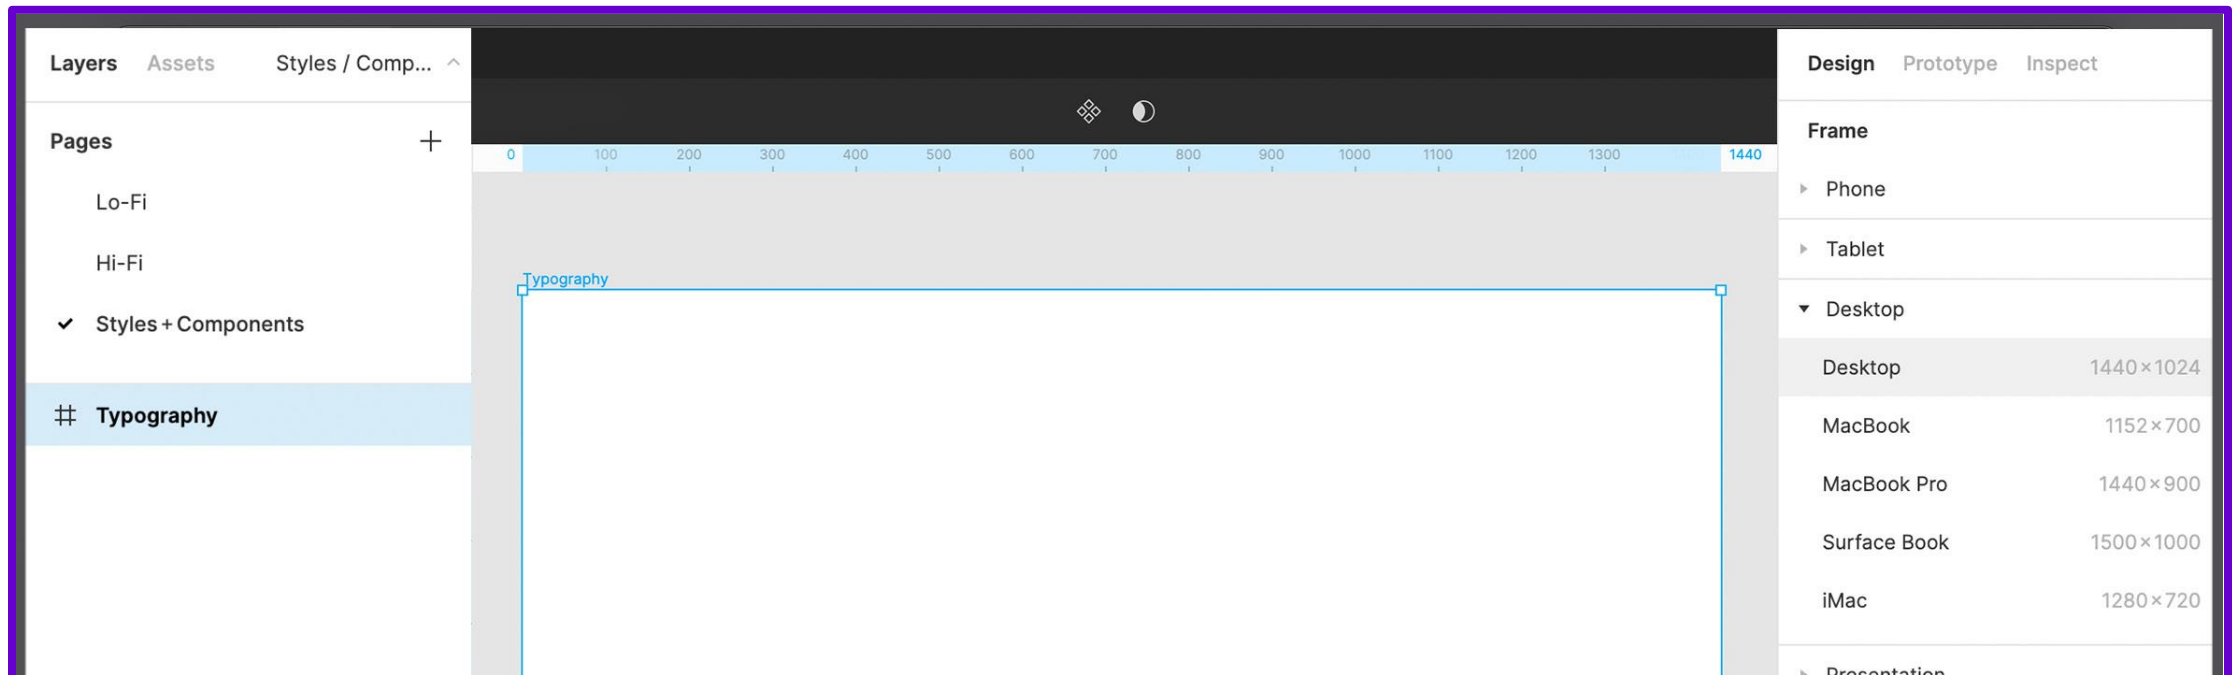

The choice of fonts for any project should, of course, be based on research and analysis.

As before, the first thing you do is create a foundation for the text styles that you will apply to the text layers in our interface

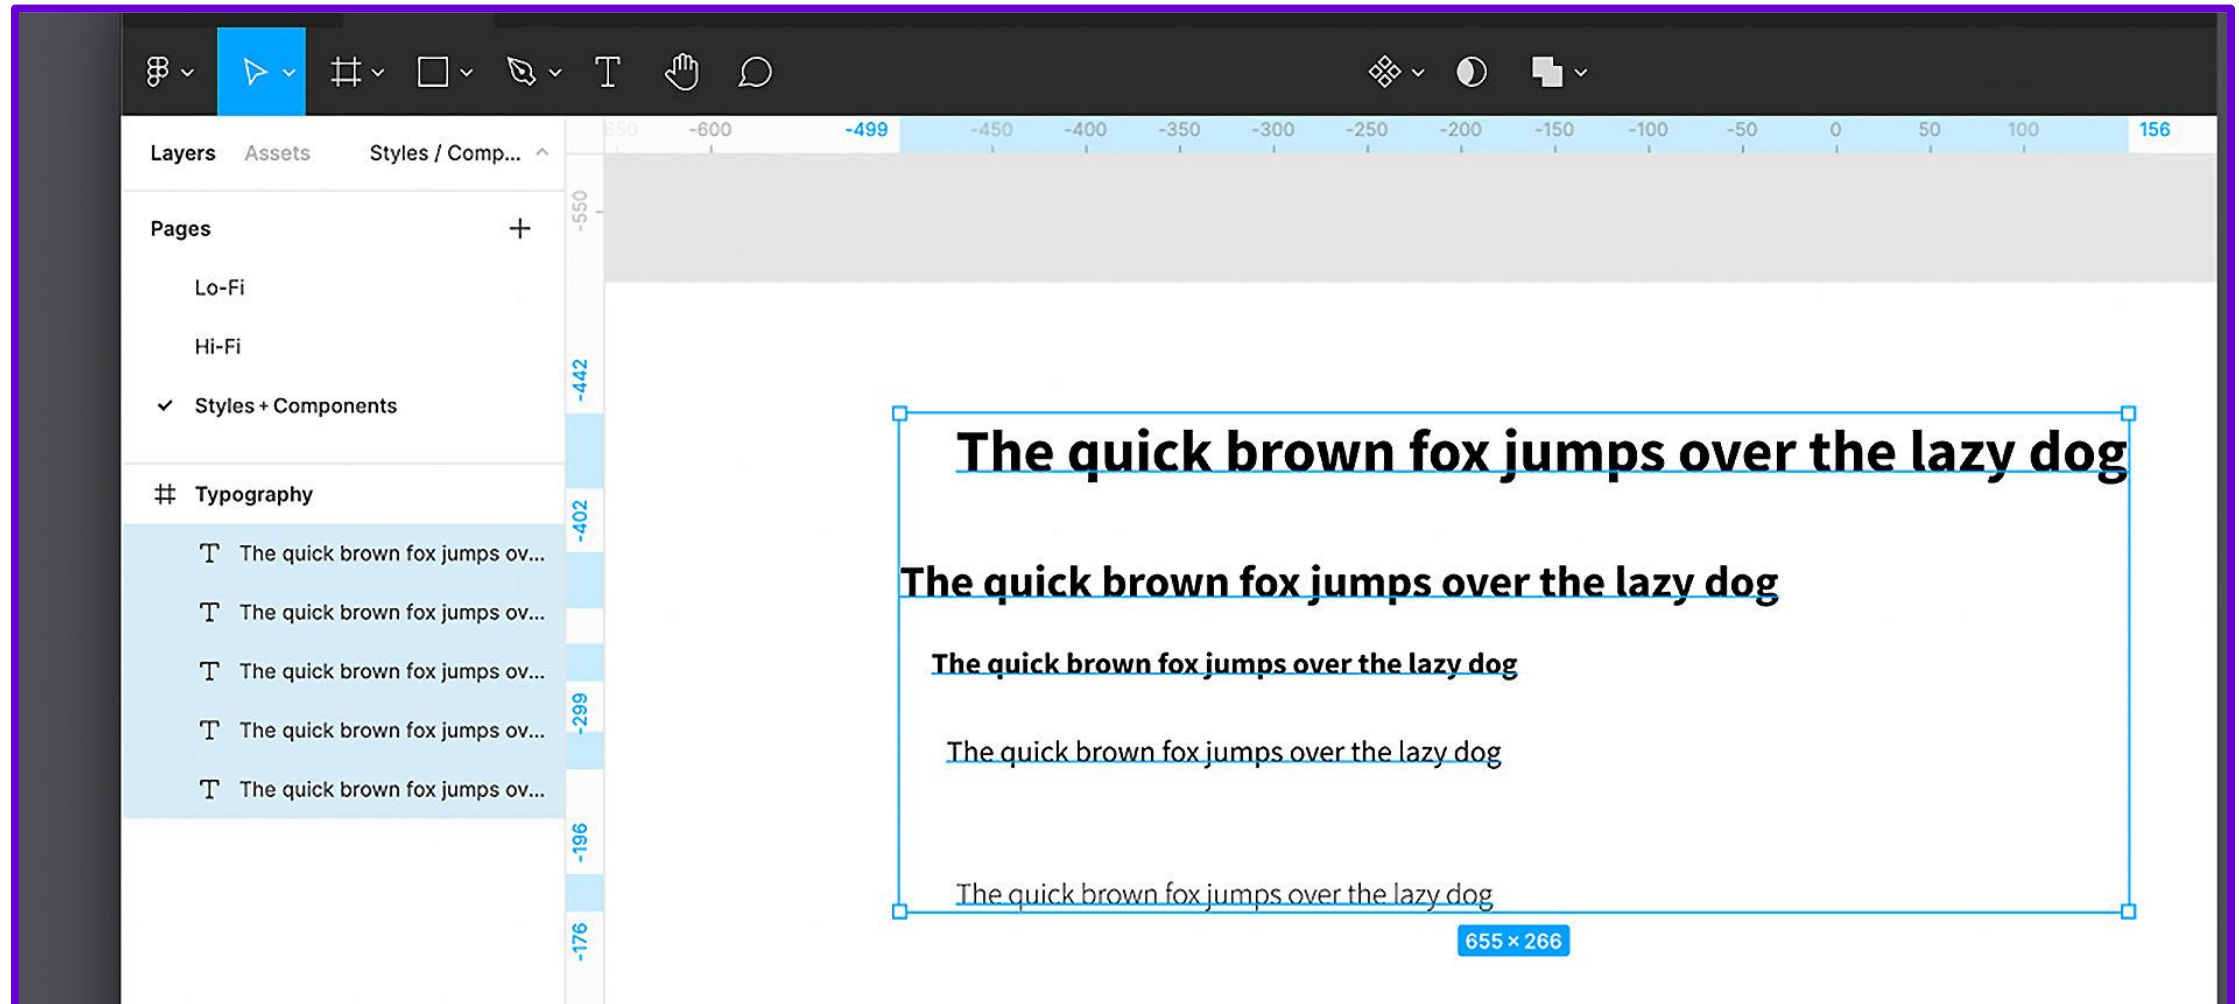

remember that you don't need to create all the text styles at once. It is normal practice to integrate new styles later if the original core of the style is well organized.

# Documenting Text Styles

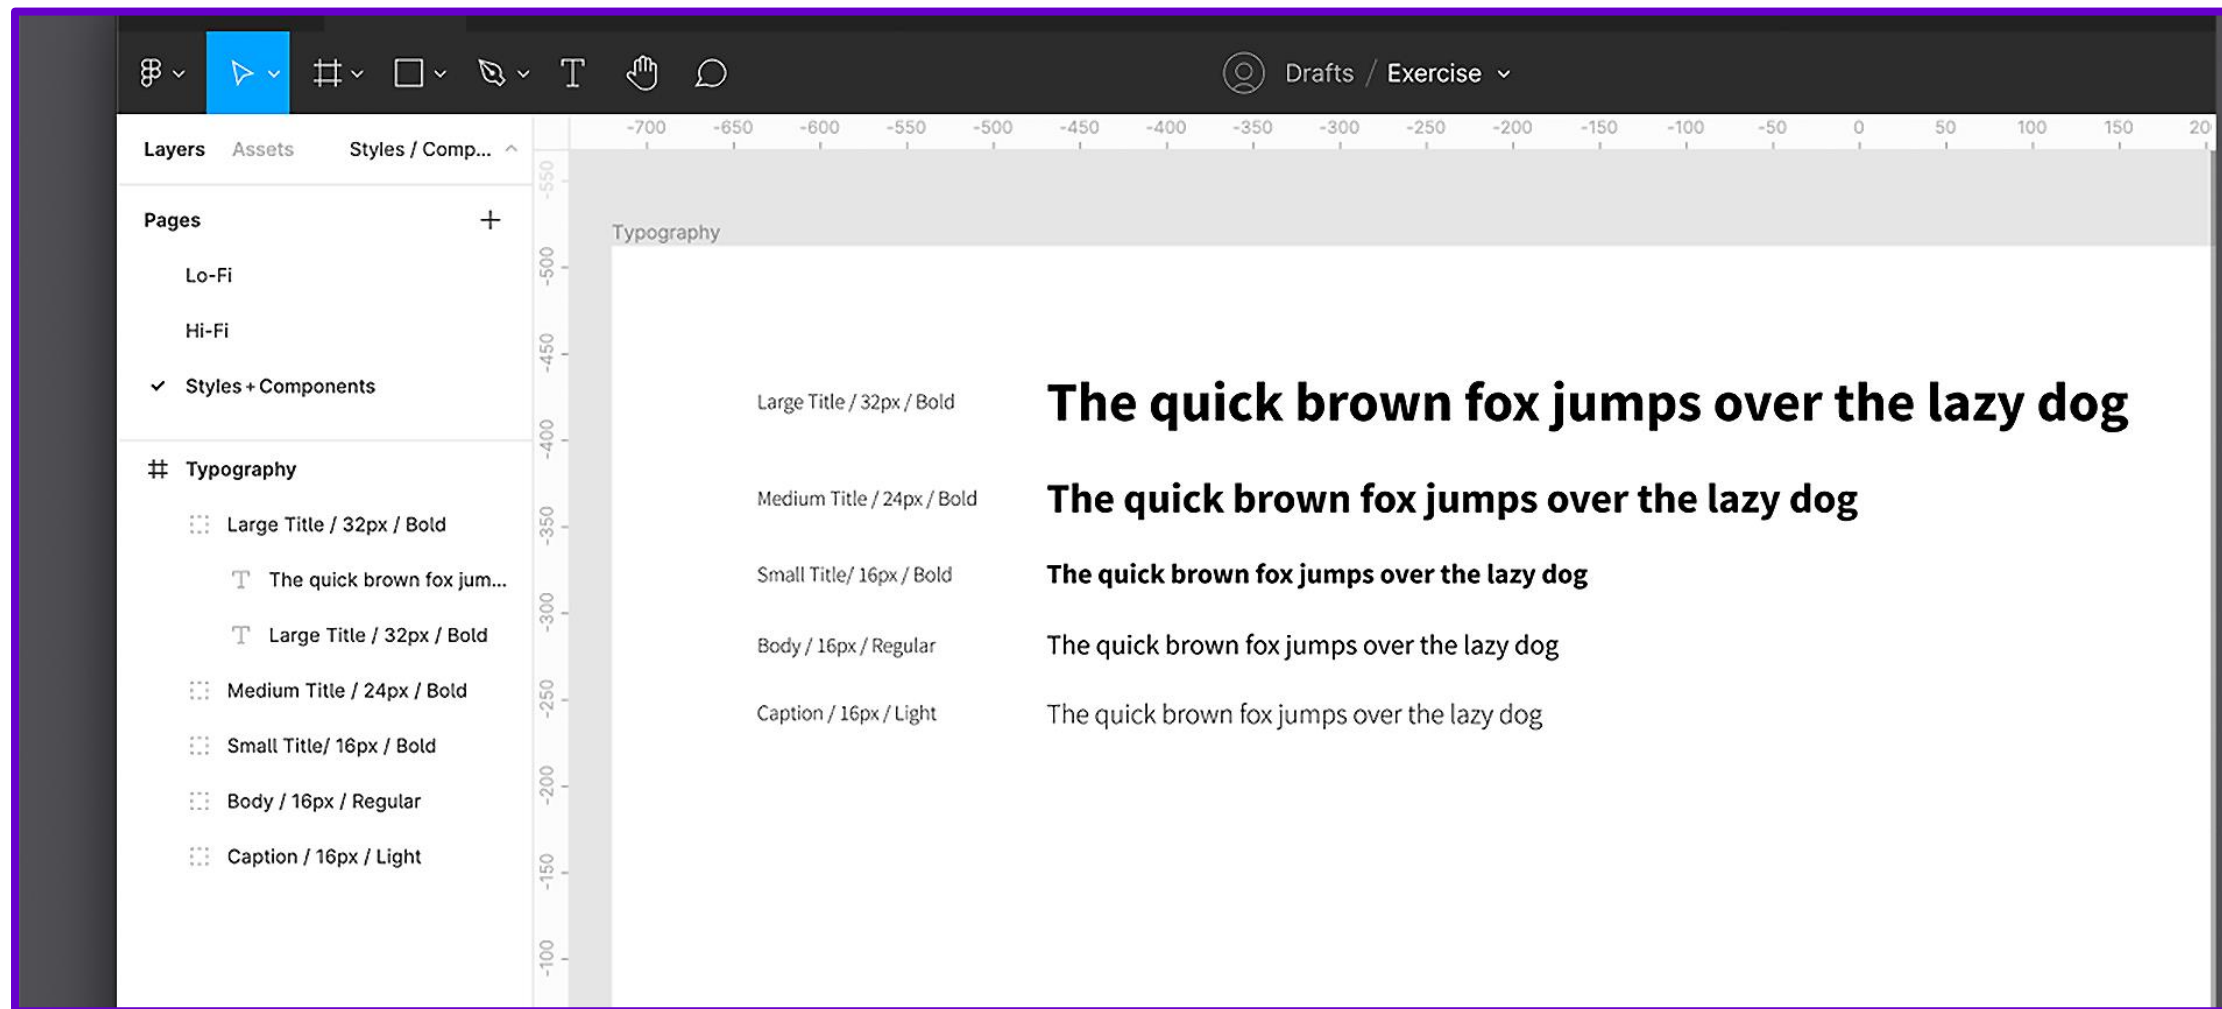

When working with styles, it is best to have all of the style properties visually displayed somewhere outside of the interface layouts.

- Background Color
- Inactive Color
- Pure White

**Effect Styles**

# Summary

the main goal of a UX/UI designer is not to be creative but to provide an interface in which every user will feel confident, and nothing will distract them from the functionality of any digital product.

This means you have to be well aware of your user's needs and pains, and anticipate specific cases where your app or website might be used to keep your design consistent and accessible.
